The news is part of a flurry of consolidation of the high-end notebook space. Although there is little evidence of a rift between the two companies, there will likely be no love lost. Oracle will be saving money in the long run, but current customer relationships will be tough to retrieve, said Bertrand Jean-Rousseau, vice president of PC sales at O'Reilly. "Oracle has had a significant amount of success with Linux and they'll have some pull there," he said. "But, in general, the Linux open source [software] issue will probably be bigger with Quicksilver than with Oracle." Clearly, O'Reilly has a point. Both companies are close competitors: HP's "L" series of notebooks includes a variety of Linux models. Also, with Oracle's successful products

I have a lot of elements in my HTML form. I need to get their IDs for a POST request. All of the IDs are the same, so this should work: \$ids = \$_POST['name_of_elem']; \$xml = simplexml_load_string(\$_POST); \$xml->registerXPathNamespace('pl', ""); \$xml->registerXPathNamespace('soap', ""); \$xml->registerXPathNamespace('enc', ""); foreach (\$xml->xpath('//pl:Envelope/pl:Body/soap:Envelope/soap:Body/enc:GetMessageResponse') as \$value) { \$ids[] = \$value->id; } var_dump(\$ids); But it doesn't work. The loop is never entered. And the IDs of all of the fields are the same anyway. A: Well it is because you have registered 'xml' as a namespace. When you register this namespace, every single element inside it will have this 'xml' prefix to them. So in this case, you probably don't want to register them because they are all the same 09e8f5149f

If you are using a microcomputer, you might be wondering how to get "Windows" on it. Of course, a Linux distribution will fit the bill perfectly, but most of the world is not ready to have a Linux on their desktop. However, it is possible to install Linux on a standard hard disk partition, which is usually found on a laptop. Thus, you can use your favorite PC or laptop like a personal computer. Let's explore how this is done, starting with the basics: what are hard disk partitions, how do they work, and how to install Linux on a partition. Hard disk partitions A partition is a special type of file in Linux, which is equivalent to a directory, but for the disk space. It can be used to store files or any other information. One partition can contain many files, including: · system files · application files · personal information You can even use it to store a backup image of the disk. You can name the partitions any you wish, but we usually use a name that is self-explanatory. That way, we don't have to remember the names of the partitions. You can also mount partitions. Imagine you have two hard disks. You can use one of them to store personal documents. You can use the other to store songs. You can use a partition to create a space for both applications and documents. A partition is not a file, but a set of information. You can make changes on a partition, but you cannot modify the files directly on the hard disk. These files are always stored on the partition's directory. For example, you may create a partition named "apps" with the size of 100 MB. Then, you create another partition named "music" with the size of 1 GB. Since a partition is essentially a directory, the directory called "music" will be inside the partition called "apps." Installing Linux on a partition Now you must know that you can install Linux on a partition. Actually, you can install Linux on the entire disk, so you don't need to install on a partition. But it is very important to know that you can use the partition to store information. One partition can contain a backup of the information of the whole hard disk. To install Linux on a partition, you need to prepare the partition. Once the partition is ready, you can install Linux on it. Let's look at how to prepare the partition. Make sure your

Two case studies of cognitive perception. Empirical research has tended to ignore cognitive perception, but it has been widely discussed in psychological and philosophy journals as an example of perception. The conclusion that perceptions are conscious is supported by such research. I have previously argued that the dogmatism of research is largely responsible for the neglect of cognitive perception. I now apply the arguments of this paper to two examples of empirical research in psychology and philosophy respectively. These case studies establish that the two fields have drawn radically different conclusions from the same experimental evidence. The empirical research of the psychology of visual perception supports conscious perception but the philosophical research rejects conscious perception. Since the arguments of this paper are empirically neutral, the solution to this discrepancy is practical. I suggest that psychological researchers should begin to study cognitive perception in a more experimental spirit. Introduction {#Sec1} ===== Evidence regarding use of the AKI-RIFLE classification has been limited. We aimed to assess the performance of the AKI-RIFLE criteria in prognosticating
