As always, we hope that they bring at least a little something to the table to make the listening experience worthwhile. So when we stumbled across this gem, we were a bit surprised. So much so, in fact, that when we listened to it, we immediately decided we had to share it with our readers. Enjoy, and check out the back story for yourself. — Jeff Goodell, editor-in-chief David Bowie's "The Man Who Sold the World" Brief Description: In the late '70s, David Bowie

recorded this album as a response to the increasingly public industry-centered ambitions of his former band, The Spiders from Mars. It eventually became the first Bowie album to be released only on vinyl, and to be produced by Tony Visconti. Long Description: As we now know, "The Man Who Sold the World" is a rather disjointed collection of classic and quasi-classical rock songs and world music interludes that Bowie recorded for his 1987 comeback album, Let's Dance. Released the following year, it seemed to be a very public demonstration of his dissatisfaction with the direction of his music. The official story behind the album is that it was recorded during a brief period when Bowie was composing material for his next album. Development in X++ Version 12 introduced a new compiler for the X++ programming language, enabling the use of a wider range of existing X++ macros than in earlier versions. This compiler is no longer in development. In X++, macros can be implemented either as X++ code, or as .NET assembly code. The X++ Macro DSL was replaced in X++ 12 by the X++ Developer Toolkit (XDT), a set of libraries and tools to aid in the creation of X++ macros. The XML Interchange Format (XIF), or XML for interchange format, was introduced in AutoCAD Serial Key 2011. Core Working space The user is represented by the current viewpoint. The viewpoints are specified as drawing objects, which are referenced in the drawing.

The viewpoints can be chosen from the views in the drawing or set up using a separate views interface. For example, the wireframe views on the left side of a screen display the elements of a model, and the wireframe views in the upper left corner display the view in which the cursor is placed. The working space is the area in which the user operates. It is divided into two zones. The default area is occupied by the drawing. An editable area is optional, and depends on the settings for the selected view.

Views The viewpoints in AutoCAD are called views. The user can switch between views by using the mouse or arrow keys on the keyboard. The views are displayed on the screen, the work area, or on paper, depending on the view setting.

The views control the following aspects of the AutoCAD drawing environment: The active space on the screen (plotter) The selection window The status bar

The toolbar The toolbar allows the user to access common tools such as zoom, pan, lock, and rotate. The tools are attached to the toolbox and can be used from the tool menu or by pressing a hotkey. The workbench The workbench is the command line interface to create and manage objects and perform most drawing-related operations. An object is any element that can be selected and handled. For example, a line, circle, circle, arc, and a 3D entity. Workbenches are available in AutoCAD and AutoCAD LT. The command line interface is available to the user if the AutoCAD command line is set to the status bar. Dialogs Dialogs are windows that cover AutoCAD areas and
