Click on Tools, then Create a New Parametric Model. In the Parameters tab, enter a name for the current drawing, and enter a number between 1 and 26 as the parameter name. Choose the graphically drawn drawing template you want to use. There are two modes of operation: Mode 1 - Create Parametric model from drawing file: Select the drawing file you want to use as a starting point. Select the desired parameter name. When the model is created, select the File > Export/Save Model option to create a.cad.dwg file. Mode 2 - Create Parametric model from AutoCAD: Open AutoCAD and select Create Parametric model from drawing file. Open the drawing file you want to use as a starting point. Enter the desired parameter name. Choose the graphically drawn drawing template you want to use. Select the File > Export/Save Model option to create a.cad.dwg file.

Creating G-codes To create G-codes, start by entering the drawing template. You will see a prompt to select a parameter value. When you select a value, a menu will appear with choices for the type of code you want to create. When you select one of the choices from the menu, the G-code that it produces is displayed at the bottom of the screen. To choose another template, click on that template name and it will replace the template currently on the screen. Lines and faces Lines, faces, circles and polygons are all 3D objects. Lines are used in the Drawing template to create closed shapes such as circles, ovals, squares, triangles, and regular polygons. The direction is specified by an angle, which can be a signed or unsigned value. The default is '0' for an upward-pointing line. When you select the Line tool, you will see a box with options on the left-hand side of the screen. One option is to start and end on a face or on a line.
