The effects of adding liraglutide to insulin therapy on glycemic control in patients with type 2 diabetes mellitus: results from the Leipzig Diabetes Study (LIDeS). Although currently recommended, the long-term safety of intensive insulin therapy (IIT) remains to be proven. Liraglutide is a glucagon-like peptide-1 receptor agonist and an attractive addition to IIT. We investigated the effects of adding liraglutide to IIT in patients with type 2 diabetes mellitus. After a 6-month run-in phase without insulin, 137 patients with type 2 diabetes were randomized to 4 treatment arms. All patients received insulin glargine. Patients in the control group continued on insulin glargine, whereas patients in the other 3 groups added liraglutide at daily doses of 0.6, 1.2, and 3.0 mg to IIT. At the end of the 24-month study period, the mean changes in HbA1c, body weight, and fasting plasma glucose were in favor of the 3.0-mg liraglutide group compared with the
